2 The management plan

2.1 The significance of the management plan

Under Article 13 of the Water Framework Directive, management plans have to be drawn up for river basin districts. They are to be published no later than nine years after the Directive has entered into force. Pursuant to Annex VII of the Water Framework Directive the management plan should contain *inter alia* the following elements:

- ∉ a general description of the river basin district, i.e. of surface waters and groundwater
- ∉ a summary of all significant pressures and anthropogenic impacts
- mapping of the protected ar

5. Public information and consultation

The Water Framework Directive provides in

LAWA Guidance Document to the Implementation of the WFD / Part 3 - status: 28.11.2001 Page -8 -

- ∉ transitional waters (e.g. estuaries)
- ¢ coastal waters up to a line of one nautical mile seawards from the baseline; with regard to chemical status, the territorial limits form the decisive boundary.

1) Reference to Directive

LAWA Guidance Document to the Implementation of

LAWA Guidance Document to the Implementation of the WFD / Part 3 - status: 28.11.2001Page -

Points to note

The groundwater bodies established with the aid of river catchment areas should, wherever possible, be taken as identical with the "survey areas" for the surface waters (Bearbeitungsgebiete), since this enables us to simplify various steps in the exercise (e.g. establishing land use, diffuse sources) regarding the assessment of surface water bodies and groundwater.

The work of delineating groundwater bodies should therefore be closely co-ordinated with the selection of the survey areas.

1.2.1.2 Characterisation of groundwater bodies

1) Reference to Directive Aricale 5[(Annex)47(e II siction o.1.and g22 C]TJ/T*-[(Annex)47(e VII siction o.1.and o.1.and

An accumulation of point pollutant sources with a significant risk potential (damage incidents, disused sites, installations using substances that are hazardous to water but have no adequate protection measures) can also result in a possible failure to achieve good chemical status even if overlay conditions are favourable and no area-wide survey findings exist that would indicate pressure potentials. If, for all risk potentials, remediation measures or protection measures are introduced which lead to the

∉ impounding lines formed by low rock permeabilities.

The sub-bodies of groundwater may consist of one or more aquifers. If deeper aquifers are taken, these will also have to be spatially delineated and assessed and, where necessary, described in further detail.

Points to note

The completion of GÜK 200, BÜK 200 (by 2002) and HÜK 200 (by 2003) by BGR is a

5) Necessary activities

The parameters determining the potential to retain pollutants, i.e. thickness,

By means of the concentration and the conditions of the chief ingredients, we establish the mean concentrations and fluctuation range for each aquifer of the groundwater body on the basis of selected groundwater content analyses, and we use this data to define the groundwater types. Anthropogenic impacts are indicated if the concentrations of certain ingredients lie outside the ranges or if substances can be identified that would not naturally occur in the aquifer.

5) Necessary activities

1.7 Public information and consultation

1) Reference to Directive

Article 14 para.1 sentence 1 WFD (Member States shall encourage the active involvement of all interested parties in the implementation of this Directive, in particular in the production, review and updating of the river basin management plans...)

2) Technical background

Article 14 WFD regulates public information and consultation in the implementation of the Directive. The details cover the 3-53

the measures which could insofar be taken by the offices responsible for the overall coordination within the respective river basin district, or by the international river

For this section of the public the above named information methods can certainly also be used. The associations and other organisations concerned are, however, often already sufficiently informed about the significance of the WFD and demand their involvement in implementation from the start. Relevant user-related information events are a possible means here. On a regional level, broader information events with the opportunity for discussion are also worth consideration. The wishes of the organised public can also be taken into a

Biological quality components

5) Necessary activities

Application of the assessment system

Points to note

For the priority substances, a thematic "chemical status" map must be drawn up once the environmental quality standards have been defined. It will have to be checked against the model ordinance for the implementation of Annex II and V.

2.1.3 Monitoring requirements, monitoring frequency

1) Reference to the Directive

LAWA Guidance Document to the Implementation of the WFD / Part 3 - status: 28.11.2001Page -

2.1.4 Classification and presentation of monitoring results (ecological and chemical status)

Under Article 2 (8) of the WFD an "artificial water body" means a body of surface water created by human activity. The category of artificial bodies of surface water includes:

- ∉ canals and channels built for navigation, for hydropower installations and for irrigation and drainage,
- ∉ lakes formed in pits, quarries and open-cast mines,
- # impounded reservoirs and artificial reservoirs,
- ∉ pools and docks.

Artificial water bodies must be designated. Artificial bodies of surface water do not, however, include natural waters that have been modified by hydroengineering

From this information we can determine the

The <u>surveillance monitoring</u> must be arranged to ensure that a coherent and comprehensive overview of groundwater chemical status can be given for each groundwater body. The monitoring network shall be designed to detect at an early stage any changes trends in chemical status. It is also necessary to register long term quality trends and establish their
